Energy Presence In Photo

Posted by Steven Matrix - 17 Aug 2011 01:33

Hey folks, I was going through some photos today and passed some photos that I had looked over before [not artsy enough]. What I didn't notice was what appeared to be some kind of energy at the bottom of the pic. I've uploaded the infrared version first [unedited], followed by the B & W converted version. I don't know how it will look on the G & H site; but my wife noticed that the energy is more prominent when standing over your computer screen, looking down from the right angle.

It is interesting to note that this "white area" appeared in the first 3 photos after I switched from just shooting color to the infrared filter; almost as if an intelligence was waiting for me to make the switch and give me something. I am very grateful.

Wow, very cool Seems like some heat source. What was the exposure time? Looks like something with a strong IR component passed through that area of the field while it was being snapped. NICE catch!

Thanks CC, exposure time was 30 seconds and it was only there for 3 photos that I was able to tell.

There are no signs of anything [that I can see anyway] in the color photos preceding this one.
