_____

I took this photo in the basement, when we were having crazy K-2 responses past 20+Gauss(mg).. I had an IR light velcroed under my video camera.. Im not a "visual person..nor do I believe more of what I see in photos

_____

the pink " misty "stuff the photos were all taken in order.. but the one of the other investigator was a mis attachment .. trying to figure out.. what caused that reaction in the photo

_____

I think it is your finger. But there is something!

==========

_____

Yeah. I am not sure if my finger can cause that or not (with the haze) I mean it wasnt humid in there, not

dusty (cement floor) I am sure the pink has to be from my finger... just never seen it make photos hazy

_____

Looks like a finger not paranormal

_____

Could very well be from your finger. I have done it before. Depends on the angle of your finger to the flash and lens. Looks like a reflected glare.

_____

thats what I was thinking.. it was pitch black in there, with exception to the IR lights and at the time my flash... I don't remember seeing anything remarkable... things like that you would think would grab your attention at the time of the photo

_____

Yeah, it looks like the camera didn't adjust for the brightness correctly. If its a fully-auto camera then sometimes there's a mode in which the camera will initiate a pre-flash burst which it uses for adjusting levels. Sometimes that doesn't work too well.

In this shot you can see how much the bright flash hitting the hand in the foreground glares. This, I have a feeling is bouncing back into the lens and bouncing back and forth between the optics creating that halo effect. And its pink because of the coloration of the hand.

This is one reason I really prefer when people upload pictures into the Albums rather than directly to the forum. Because the photo album area keeps the images in their original form, and allows you to see

the EXIF data. The EXIF data really would tell the whole story here.
