Wow what a picture. I know this is in the hospital but is there anyone else in the room that would show that reflection in the mirror. Can you give some detail on this very intersting.

First and foremost congratulations on your daughters birth.

A few things I notice is that the mirror has some smudges on it and streaks which accounts for SOME but not all of the effects. What remains is very interesting.

I'm not a sensitive, but I would have to think that hospitals would be hot beds of spirits. Either in transition or lost and confused. And from what I understand spirits tend to be drawn to new life. So I would not be surprised if there were some spirits in the room with you. Although it would not be anything to fear. I would say its just a part of life, but well that phrase would not be correct in this case.

Well, it certainly could be smudges on the mirror, but that is really interesting. Totally looks like a person.

The close up image does show that the mirror is really dirty, and the smears are lit up by the flash, but it still looks like there's something else going on.

When I looked at it the first time I wondered if there was a reflection of a reflection, like the TV was going or something, but the TV is in the photo and it's off.

Well, with a mirror several things can be taking place. The fingerprints and dirt obviously are one, and we can clearly see that happening in this photo. But those are fairly easy to determine. But there are other "possible" things which could cause mirrored effects.

First there are two types of mirrors. First surface mirrors (usually found in scientific grade devices such as microscopes, telescopes, and laser optics) and second surface mirrors. The difference is which surface of the glass is coated with the mirrored coating.

First surface mirrors have the very outer edge of the mirror coated. This means the light does not pass through the glass to be reflected. It reflects directly off of the outer edge. These are usually much more accurate and not as prone to visual effects.

Most consumer grade mirrors however are not this type. Instead the back surface of the mirror is coated. Which means that light must first travel through the glass, reflect off of the mirrored surface and then pass through the glass again. Because of this you can actually get multiple depth effects of smudges on the glass. Also you an get effects if the mirrored coating is scratched, weakened or separating from the glass. Because of that you can get strange visual effects such as this.

Not saying thats whats happening here, but that is a possibility. The only way to know for sure is with multiple images of the mirror from different vantage points, or video which could move through several linear vantage points in its motion.
